LCSD05 Clinical Linguistics and Phonetics
Phonetic Transcription Exam

The data set comprises three parts: 15 nonsense words, 20 single words based on authentic clinical data and 5 sentences, also based on clinical data. Each word/sentence will be said 3 times.

Use broad phonetic transcription: you do not need to indicate allophonic variants such as aspirated plosives or dark [ɫ]. However, you will need to indicate connected speech process, eg any examples of assimilation or liason across word boundaries, where these occur in the connected speech data. You do not need to indicate stress in either the single words or the connected speech data.

Nonsense words [15 marks]

The first two words are 'dummy' items to familiarise you with the procedure.
